

# 9 Things to Look for in a Transportation Management System

## 01 Automates processes

- It automates your most difficult processes, so your team operates more efficiently, and you save time and money with fewer errors.

## 02 Deliver insights for improvements

- Its dashboards and analytics provide the critical insights you need to truly move the needle and improve your business, not just keep it running.

## 03 Actively manage exceptions

- It relies on predictive exception management capabilities for shipments across rail, truck, barge, and ocean modes.

## 04 Manage all modes in one place

- It enables easy, seamless booking of a shipment, regardless of whether it's via rail, ocean, or truck without changing accounts, systems, or even windows.

## 05 Features unique to your challenges

- It employs unique features like SaaS-based dock scheduling for real-time visibility to simplify scheduling dock appointments, improve labor planning, and improve the throughput of your docks.

## 06 Enhance your carrier network

- It provides an ever-expanding tendering algorithm that expands the carrier pool over time instead of closing it.

## 07 Automate tendering process

- It lets shippers and brokers set up automated tendering processes that controls carrier visibility of loads and defines the order in which they view them.

## 08 Improve accuracy of invoices

- It uses intelligent algorithms to automatically audit every invoice received, ensuring it's accurate on every line item and either allowing automated payment or identifying it for dispute if outside your stated parameters.

## 09 Integrates with other systems

- It integrates with other load boards, giving shippers and third-party logistics providers (3PLs) a single system to manage contract freight, private fleets, and spot market moves.
